

# Project arXiv Citation Network

---

## Contributors

- [Minh Tran](#)
- [Leo Ho](#)

## 0. Usage

### Data Preparation

To prepare the data, run the following command:

```
python3 cite_parser.py
```

This will generate csv files for the nodes and edges of the citation network.

### Neo4j Database

To load the data into a Neo4j database, run the following command:

```
python3 load_neo4j.py
```

This will load the data from the csv files into a Neo4j database.

[!NOTE] If it takes too long to load the data, you can change the number of random samples in the `prepare_data.py` file (`N_SAMPLES` variable).

## 1. Introduction

This project aims to analyze the citation network of arXiv papers. We use Python to clean the data and create a Neo4j network to visualize and analyze the citation relationships between arXiv papers.

## 2. Data Description

The data was extracted from: <https://github.com/mattbierbaum/arxiv-public-datasets/releases/tag/v0.2.0>. More exactly, we'll use the file `internal-references-v0.2.0-2019-03-01.json.gz`, which contains the list of papers and their references, all papers using their arXiv IDs and `oai-arxiv-metadata-hash-abstracts-2019-03-01.json`, which contains the metadata of the papers.

The processed dataset is stored in JSON format. It contains metadata for arXiv papers, including titles, authors, abstracts, and references. The data is stored in two files:

- `data/oai-arxiv-metadata-hash-abstracts-2019-03-01.json`
- `data/internal-references-pdf-totext.json`

## Neo4j Network

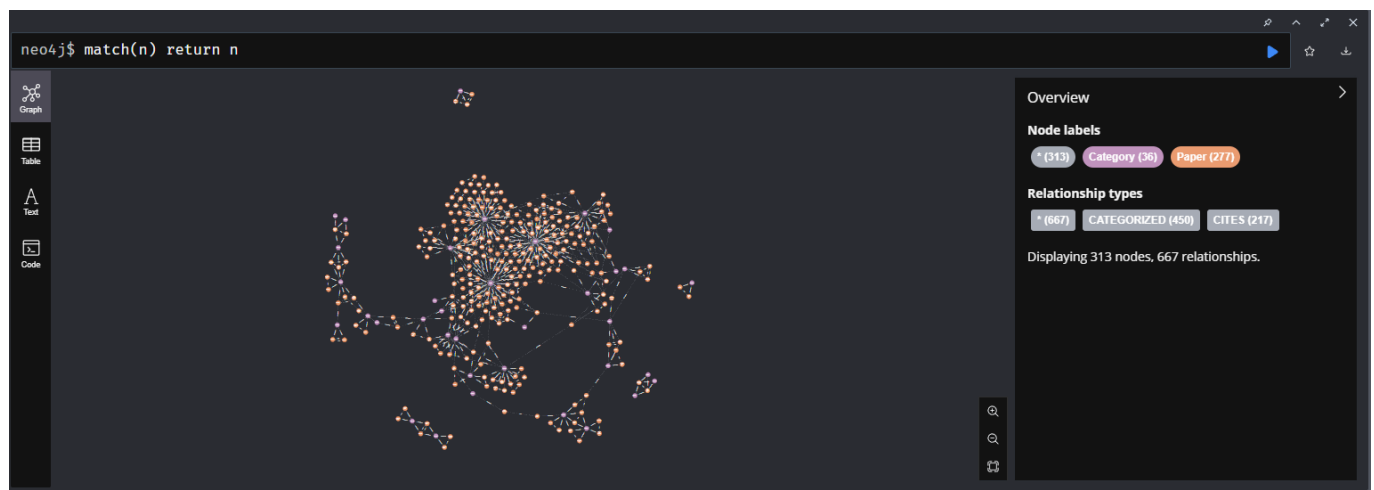

Using Neo4j, we created a citation network for the arXiv papers. The nodes represent papers and categories, while the edges represent citation and categorization relationships. By running the Neo4j command:

```
MATCH (n) RETURN n
```

we visualize the citation network where:

- **Paper nodes** have attributes such as:
  - **elementId**: Element ID of the paper
  - **id**: Identifier of the paper
  - **abstract\_md5**: MD5 hash of the abstract
  - **authors**: List of authors
  - **doi**: Digital Object Identifier
  - **idAxxv**: arXiv identifier
  - **report\_no**: Report number
  - **submitter**: Paper submitter
  - **title**: Paper title
- **Category nodes** have attributes like:
  - **elementId**: Element ID of the category
  - **id**: Identifier of the category in the graph
  - **category**: Name of the category
- **Relationships**:
  - **CATEGORIZED**: Connects papers to categories. It has attributes **elementId** and **id**.
  - **CITES**: Represents citations between papers. It has attributes **elementId** and **id**.

The network consists of **313 nodes** and **667 relationships**.

## 3. Analysis

3.1 Network Metrics

Average Citations per Paper

- The average number of citations per paper is **0.783**.
- This suggests that many papers are either not cited frequently or not cited at all.

```
1 MATCH (paper:Paper)
2 OPTIONAL MATCH (paper) <-[cites:CITES]-()
3 RETURN COUNT(cites) * 1.0 / COUNT(DISTINCT paper) AS average_number_of_being_cited_each_paper
```

average_number_of_being_cited_each_paper
0.7833935018050542

Started streaming 1 records in less than 1 ms and completed after 2 ms.

Papers per Category

- The following graph shows the distribution of papers across different categories.

```
1 match(category:Category)
2 match (:Paper) -[categorized:CATEGORIZED]->(category)
3 return category.category as category_name, count(categorized) as number_of_paper order by number_of_paper desc
```

Maximums:

- The table reveals that the most popular category is *hep-ph* (High Energy Physics - Phenomenology) with 95 papers, followed by *hep-th* (High Energy Physics - Theory) with 80 papers. The least popular categories are *math.GN* (General Topology) and *cs.DM* (Discrete Mathematics), each with only 1 paper.
- The most frequently cited paper is titled "Stringy Instantons at Orbifold Singularities," which has been cited 3 times.
- The maximum number of papers authored by a single author is 2, with 14 different authors contributing exactly 2 papers each.

Density:

- The network's density is calculated as 217 (the total number of **CITES** links) divided by 38,226 (the total number of possible **PAPER** node pairs), yielding a density of 0.005. This indicates that the network is very sparse, which is typical of citation networks. Not all papers cite every other paper, and citations are generally selective.

3.2 Node pair metrics

- The most cocitation:

```
1 MATCH (p1:Paper)←[:CITES]-(citingPaper:Paper)-[:CITES]→(p2:Paper)
2 WHERE id(p1) < id(p2)
3 RETURN p1.title AS Paper1, p2.title AS Paper2, COUNT(citingPaper) AS CoCitationCount
4 ORDER BY CoCitationCount DESC
```

- We picked the top 4 cocitation pairs to show the most cocitation pairs since the table is too long to show all of them.

Paper1	Paper2	CoCitationCount
--------	--------	-----------------

Paper1	Paper2	CoCitationCount
"Strong Phase and $D^0$ - $\bar{D}^0$ mixing at BES-III"	" $D$ - $\bar{D}$ mixing and rare $D$ decays in the Littlest Higgs model with non-unitarity matrix"	2
"Marginal Solutions for the Superstring"	"Analytic solutions for marginal deformations in open superstring field theory"	2
"Numerical Evaluation of Six-Photon Amplitudes"	"Direct extraction of one-loop integral coefficients"	2
"Improved Measurement of the Positive Muon Lifetime and Determination of the Fermi Constant"	"Measurement of the Rate of Muon Capture in Hydrogen Gas and Determination of the Proton's Pseudoscalar Coupling $g_P$ "	2

- The table is make sense since the most cocitation pairs are the pairs that are related to each other. For example, the first pair is about the mixing of  $D$  mesons and the second pair is about the marginal solutions for the superstring.
- The most bibliographic coupling:

```
1 MATCH (p1:Paper)-[:CITES]->(citedPaper:Paper)<-[:CITES]-(p2:Paper)
2 WHERE id(p1) < id(p2) // Ensure each pair is counted only once
3 RETURN p1.title AS Paper1, p2.title AS Paper2, COUNT(citedPaper) AS BibliographicCouplingCount
4 ORDER BY BibliographicCouplingCount DESC
```

Paper1	Paper2	BibliographicCouplingCount
"Implication of the $D^0$ Width Difference On CP-Violation i n $D^0$ - $\bar{D}^0$ Mixing"	" $D^0$ -anti- $D^0$ Mixing and CP Violation in $D^0$ vs anti- $D^0$ to $K^*$ ( $+$ -) $K$ (- $+$ ) Decays"	2
"Marginal deformations in string field theory"	"Real analytic solutions for marginal deformations in open superstring field theory"	2
"On-Shell Methods in Perturbative QCD"	"One-loop $\phi$ -MHV amplitudes using the unitarity bootstrap"	2
"Muon Physics: A Pillar of the Standard Model"	"Electroweak Radiative Corrections to Muon Capture"	2

- From the cocitation and bibliographic coupling tables, we can see that the most cocitation and bibliographic coupling pairs are related to each other. On the one hand, the number of cocitation and bibliographic coupling pairs is very low compared to the number of papers. This is because not all papers are cited by all other papers and vice versa which is common in citation networks.

3.3 Nodes Metrics

1. The paper with the highest degree (using Neuler):

Paper	
Node	Score
Moriond QCD 2007 - Theory Summary	5
The Casimir Force in Randall Sundrum Models	4
Particle Interpretations of the PVLAS Data	4
The Extragalactic Gamma Ray Background	4
D0-anti-D0 Mixing and CP Violation in D0 vs anti-D0 to K*(+/-) K(-/+) Decays	3
On-Shell Methods in Perturbative QCD	3
Type I singularities and the Phantom Menace	3

The result shows that the paper titled "*Moriond QCD 2007 - Theory Summary*" has the most connections to other papers, with 5 citations.

2. The paper with the highest betweenness centrality (using Neuler):

NEuler	
Home	Run Single Algorithm

Holographic Electroweak Symmetry Breaking from D-branes	15
Stringy Instantons at Orbifold Singularities	14
Searching for Lee-Wick Gauge Bosons at the LHC	13

The result shows that the paper titled "*Moriond QCD 2007 - Theory Summary*" has the highest betweenness centrality with a score of 24. This indicates that this paper plays the most crucial role in the network, acting as a bridge on the shortest paths between other papers.

3. The paper with the highest closeness centrality (using Neuler):

Paper	
Node	Score
The Epps effect revisited	1
Gauge Mediation in String Theory	1
Curvature estimates for Weingarten hypersurfaces in Riemannian manifolds	1
Symplectic homology, autonomous Hamiltonians, and Morse-Bott moduli spaces	1
Analytic solutions for marginal deformations in open superspring field theory	1
Quantum and Classical Spins on the Spatially Distorted Kagome Lattice: Applications to Volborthite	1
A Symplectic Test of the L-Functions Ratios Conjecture	1

The result shows that all papers have the same closeness centrality score of 1. This suggests that each paper is equally close to all other papers in the network, meaning they either cite or are cited by each other. This is typical in citation networks where papers are interconnected.

4. The paper with the highest eigenvector centrality (using Neuler):

Paper	
Node	Score
Marginal Solutions for the Superstring	0.45681629777609983
Analytic solutions for marginal deformations in open superstring field theory	0.45681629777609983
Direct extraction of one-loop integral coefficients	0.45681629777609983
Numerical Evaluation of Six-Photon Amplitudes	0.45681629777609983
One-loop phi-MHV amplitudes using the unitarity bootstrap	0.24836600407745177
Real analytic solutions for marginal deformations in open superstring field theory	0.24836600407745177

The result shows that the following papers have the highest eigenvector centrality with a score of 0.45:

- "Marginal Solutions for the Superstring"
- "Analytic Solutions for Marginal Deformations in Open Superstring Field Theory"
- "Direct Extraction of One-Loop Integral Coefficients"
- "Numerical Evaluation of Six-Photon Amplitudes"

This means that these papers are the most influential and prestigious in the network since they are cited by other important papers.

5. Papers with the highest clustering coefficient (using Neuler):

Node	Coefficient
Strong Phase and $SD^0 \rightarrow D^0 \bar{D}^0$ mixing at BES-III	1
Marginal Solutions for the Superstring	1
Measurement of the Decay Constant $f_{D^*} \text{ (} S^+ \rightarrow \dots \rightarrow \ell \bar{\nu} + \nu \text{)}$	1
Symplectic homology, autonomous Hamiltonians, and Morse-Bott moduli spaces	1
Study of $B^+ \rightarrow p \Lambda_{\text{b}} \bar{d} \pi^0$ and $B^0 \rightarrow p \Lambda_{\text{b}} \bar{d} \pi^-$	1
Dynamical Casimir effect for gravitons in bouncing braneworlds	1
A biased view of symplectic cohomology	1
Analytic solutions for marginal deformations in open superstring field theory	1
Two Results on Homogeneous Hessian Nilpotent Polynomials	1
Fractal dimension of domain walls in two-dimensional Ising spin glasses	1
Another Odd Thing About Unparticle Physics	1
Observation of the Decay $\bar{B}^0 \rightarrow D^+ \Lambda_{\text{b}}^- \pi^-$	1
Domain wall entropy of the bimodal two-dimensional Ising spin glass	1
Domain-wall/Cosmology correspondence in $adS/dS$ supergravity	1
The dynamical Casimir effect in braneworlds	1
Scaling cosmologies, geodesic motion and pseudo-susy	1
A Search for Electron Neutrino Appearance at the $\Delta m^2 \sim 1 \text{ eV}^2$ Scale	1
Numerical Evaluation of Six-Photon Amplitudes	1
Sterile neutrinos at the CNGS	1
Some Properties of and Open Problems on Hessian Nilpotent Polynomials	1
A Vanishing Conjecture on Differential Operators with Constant Coefficients	1
Direct extraction of one-loop integral coefficients	1
An exact sequence for contact- and symplectic homology	1
Marginal deformations in string field theory	1
Measurement of $B(D^+ S^+ \rightarrow \dots \rightarrow \ell \bar{\nu} + \nu)$ and the Decay Constant $f_{D^*} \text{ (} S^+ \text{)}$	1

Collider signals in unparticle physics	1
Droplets in the two-dimensional $\pm J$ spin glass: evidence for (non-) universality	1
One-loop $\phi$ -MHV amplitudes using the unitarity bootstrap	1
Real analytic solutions for marginal deformations in open superstring field theory	1
Pseudo-supersymmetry and a Tale of Alternate Realities	1

The results show that there are 30 papers with the highest clustering coefficient of 1. This indicates that these papers form a highly interconnected cluster where they cite each other, which is common in citation networks, especially among papers in the same category.

## 4. Limitation

- This analysis is that the Neo4j graph is not large enough to fully represent all 4,000 papers, which means the results may not be entirely accurate.
- The analysis is based solely on the data present in the graph database, which may not provide a comprehensive view of the citation network.
- The data is limited to arXiv papers, which may not represent the entire field of research in the scientific community.
- The dataset is released in April 2019, which may not include the most recent papers and citations.
- We just generate a subset of the data to analyze the network due to the limitation of the computer's memory and processing power. This may lead to inaccurate results.

## 5. Conclusion

Through the application of various data analysis techniques and tools, we effectively analyzed the citation network to identify key papers, popular categories, frequently co-cited and bibliographically coupled pairs, and influential publications. This analysis offers insights into the citation network's structure and the relationships among its papers.

However, the analysis is limited by the incomplete dataset within the graph database, which restricts a comprehensive representation of the network. Future work will prioritize refining the data collection algorithms to capture a more complete and accurate view of the citation network.
